Abstract : HTS (High Temperature Superconductor) cable has a high possibility of practical use due to the possibility of low voltage and high capacity transmission caused by its lower power loss than copper cable. On the other hand, when fault current occurred, resistance increase caused by superconductivity loss, the amount of power supplies has diminished, furthermore, it’s necessary to take the possible danger of damage to HTS cable into account. Therefore, an effective plan for dealing with the above problem is to link HTS cable to SFCL. In this study, we researched the possibilities of normal transport current as well as the safety of HTS cable by analyzing the properties of transport current in HTS cable connected with SFCL.

Key Words : HTS cable, SFCL, YBCO coated conductor
