- Abstract -

The development of information and communication technology (ICT) has changed how governmental organizations communicate with the public, business society, and other governmental organizations. ICT implementation in the government, also known as e-Government, is expected to provide the benefits of efficiency, effectiveness, transparency, and accountability of governmental administrative activities. This paper describes the ICT development in Indonesia and its future plan in achieving The World Summit Information Society (WSIS) target in 2015. Not only looking at the position of Indonesia compared to other developing countries, details on steps, framework, and achievement are also presented.
